Smart Home Technology

Smart home technology integrates your home with computer technology to make it work smarter for you. By automating processes throughout your home, smart home technology makes homes safer, more efficient, and more convenient.

You may think smart home technology is a hope for the near future, but the technology is actually available today. You may even have some smart home technology in your own home. Programmable thermostats, automatic coffeepots, and remote-controlled windows are just a few examples of this technology already in common use.

Another great example of smart home technology already in use is the home theater system. Home

theaters can be wired together to be controlled with a single remote and can include hidden, rising screens, lighting controls, surround sound speakers, and more.

As the demand for convenience in the home grows, more and more smart home appliances have been introduced to the market. For example, several manufacturers have begun producing smart refrigerators with computer systems integrated inside. These refrigerators can keep notes, store appointments, download recipes and monitor the inventory inside.

Another new product is the smart showering system. With new advanced showering systems, featuring multiple jets, multiple pressures, ambient light, and even music, you can use special control panels to program your shower or change the settings.

The fully automated smart home is becoming closer to reality every day. Compare it to the microwave or the personal computer. Once a luxury, now most households find it almost impossible to live without them.

Home Maintenance Reminder: Inspect Bathroom for Crumbling Grout or Loose Caulk

Grout and caulk are applied to prevent water from leaking into your wall or under your floor. When they are deteriorating, leaking water can cause significant damage to your home. It should be checked regularly replaced as soon as possible if a problem is detected.

See you next month!
